                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes pure zonulin which has an apparent molecular weight of 47 kD, as determined by SDS-PAGE, which is recognised by both anti-tau polyclonal antibody and by anti-zonula occludens toxin (ZOT) polyclonal antibody, and is capable of reversibly opening mammalian tight junctions. Zonulin proteins function as physiological modulators of mammalian tight junctions. They can be used for enhancing the absorption of therapeutic agents across tight junctions of intestinal and nasal mucosa and across tight junctions of the blood brain barrier. Zonulin can be used with agents such as drugs, norepinephrine, adenosine, dobutamine, dopamine, epinephrine, nalbuphine, huntrance, phentolamine, doxapram, alfentanil, dezocin, nalbuphine, huntrance, phentolamine, doxapram, alfentanil, dezocin, nalbuphine,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             buprenorphine, naloxone, ketorolac, midazolam, propofol, metacurine, midazolam, propofol, metacurine, midazolam, propofol, metacurine, wincristine, vinblastine, cytarabine, mitomycin doxorubicin, vincristine, vinblastine, methicillin, mezlocillin, piperacillin, cetoxitin, cefenicid, cefmetazole and azireonam, a hormone e.g. testoxiterone, nandrolene, menotropins, insulin, urofolitropin, interferon-lapha, interferon-beta, interferon-gamma, interfeukin-1 (II-1), II-2, II-4, II-8, polyvalent IgG, specific IgG, IgA, or IgM. The proteins can also be used for the production of antibodies which can be used to assay for zonulin in body tissue or fluids, or in affinity-purification of zonulin. The present sequence represents an N-terminal peptide of zonulin.

The N-terminal sequences of human adult and foetal zonulins (see Y79130-36) were compared with Vibrio.cholerae zonula occludens toxin (ZOT) to identify a common motif thought to be involved in receptor binding. Peptide antagonists (see Y79105-29) based on this motif are useful as antiinflammatory agents for treatment of gastrointestinal inflammation, and for treatment of conditions associated with breakdown of the blood-brain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                999999999999999998888<del>%</del>&
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        cc interleukin-12 (IL-12). The invention also includes antigen binding cportions that bind to IL-12. Sequences B39485-B39516 represent human cc anti-IL-12 antibody heavy and light chain complementarity determining cc anti-IL-12 antibody heavy and light chain complementarity determining cc region (CDR) amino acid sequences, and also includes variable region amino acid sequences are given in B39517-B39560 and B40068-B40149. Sequences B39772-B40063 crepresent anti-IL-12 CDR3 related amino acid sequences, B39772-B40063 crepresent other CDR sequences. Light chain CDR3 consensus sequences are given in B40064-B40067. Primers used in the identification and CC construction of the antibodies of the invention are given in CC construction of the antibody of the invention is a neutralising antibody cand has antirheumatic; antiarthritic; antisclerotic; antiparasitic; antibacterial and immunosuppressive activity. The antibodies or antibacterial and immunosuppressive activity. Sepecially Crohn's classes, multiple selevosts and repumatorial architis. They can also be called to the manifest traces and architists.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

Protein sequences (R66295-51) are novel human immunoglobulin heavy chain sequences encoded by novel isolated genes. The genes (078939-79002) were isolated and cloned from a series of cosmid constructs: Y202; Y103; Y21; Y6;Y24; 3-31; M84; M118 and M131, by PCR amplification using primers 078917-38. The genes are subdivided into 5 families of Vh genes. The fragments cover a region of 800 kb. The DNA fragments were isolated from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Primer; cosmid;

                            This is the amino acid sequence of the human D7.2 heavy chain variable region, used in the method of the invention. for providing receptors that can be used for targeting antigens in humans without being immunogenic themselves. Such receptors can be used for treating diseases such as tumours or auto-immune diseases, graft rejection after transplantation, infectious diseases by targeting cellular receptors as well as allergic, inflammatory, endocrine and receptors as well as allergic, inflammatory, endocrine and
                                                                                                                                                                                          Production of anti-human antigen receptors -combination of functionally rearranged VH and chains expressed from a recombinant vector
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             high molecular weight DNA from human placenta. The DNA was partially digested with TaqI restriction enzyme. The fragments were separated by gel elecrophoresis and 35-45 kb fractions were collected. The fragments were ligated with ClaI-digested cosmid vector pJB81. The ligation products were in vitro packed and infected into E.coli 490A. The fragments were then subcloned by colony hybridisation. The Vh genes and the DNA fragments encoding them are useful in producing human immunoglobulin in mammalian hosts.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Š
            The present sequence represents the N-terminal of a human zonulin college to polypeptide. The specification describes a method of suppressing antigen presenting cell (APC)-mediated lymphocyte proliferation in a mammalian host pre-exposed to a particular antigen. The method comprises administering to the host an effective amount of a zot-related from the control of the APC. The method can be used to down-regulate the activity of the APC. The method can be used to down-regulate APC-mediated lymphocyte proliferation in mammalian hosts suffering from auto-immune or immune-related collisorders, immune system rejection subsequent to tissue or organ collisorders, immune system rejection subsequent to tissue or organ collisorders, insulin dependent diabetes mellitus, celiac disease, 3) or inflammatory or allergic diseases. The auto-immune collisorders include multiple sclerosis, rheumatoid cor immune related disorders include multiple sclerosis, rheumatoid corrected and the related disorders include multiple sclerosis, rheumatoid corrected disorders include multiple sclerosis rheumatoid corrected disorders include multiple sclerosis rheumatoid corrected disorders include multiple sclerosis rheumatoid disorders include multiple sclerosis rheumatoi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

                       A B-cell superantigen (sAg) is a fragment of SpA D domain that specifically binds the Fab portion of variable region restricted antibodies. The sAg is used to enhance production of VH, especially VH3, restricted Abs. During attempts to identify sAgs, aa sequences (R54784-801) of H chains from Ig reactive with mod-SpA, and aa and DNA sequences (R54802-16, Q64842-56) of VH regions of SpA binders obtained from combinatorial libraries were determined.
                                                                                                                                                                   Stimulating prodp. of variable region gene family restricted antibodies - through B-cell super-antigen vaccination

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           analogue peptides. The peptides selectively bind to an antigen on the surface or in the cytoplasm of a neoplastic cell. They comprise at least one CDR and at least one V region of L- or H-chains from an anti-human mammary fat globule antigen antibody (i.e. murine BrE3 antibody) but where I to 46 amino acids in the FRs are substituted by their homologues from human antibodies (humanised). The humanised antibody is useful for carcinoma therapy and diagnosis and for in vivo imaging of neoplastic cells. It is also of use in inhibiting the
                                                                                                                                                                                                                                                                                                                          Region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and one B7.1 molecules. It has a rigid structure that prevents simultaneous binding to the 3 targets. Each antigen-binding site is formed by pairing of one VH and one VL domain from the same or from two different polypeptides. The invention relates to novel molecules, including triabodies, which can cross-link and/or cross-react with the costimulatory molecules B7.1 and B7.2 expressed on professional antigen-presenting cells, leading to the inhibition of antigen-specific T cell activation. Methods are provided for the production of such B7-binding molecules, and for their use in the treatment or prevention of diseases of the immune system, in particular graft rejection, graft versus host disease, allergy and autoimmune diseases (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           B7 binding molecule; costimulatory molecule; B7.1; CD80; B7.2; CD86; T cell activation; inhibitor; graft versus host disease; transplant rejection; allograft rejection; autoimmune disease; allergy; therapy; human; diabody; antibody; B7-24.
    New molecules which bind B7.1 and B7.2 • useful to prevent and treat immune.diseases including allograft rejection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This polypeptide comprises a B7-24 monospecific diabody composed of the VH region of anti-B7.1 monoclonal antibody (MAb) B7-24. To joined via a short, flexible linker to the VL region of B7-24. Charles or bispecific bivalent molecules are generated by shortening the flexible linker sequence between the VH and VL of the anti-B7.1 color bispecific molecules by cross-pairing the VH and VL of the anti-B7.1 color bispecific molecules by cross-pairing the VH and VL domains of the product of the anti-B7.2 color bispecific molecules by cross-pairing the VH and VL domains of the 2 scFvs with different antigen recognition (B7.1/B7.2 and CR br.12/B7.12). The invention relates to novel molecules, including CR br.12/B7.12. The invention relates to novel molecules, including CR diabodies, which can cross-link and/or cross-react with the costimulatory molecules B7.1 and B7.2 expressed on professional antigen-presenting cells, leading to the inhibition of antigen-production of such B7-binding molecules, and for their use in the creatment or prevention of diseases of the immune system, in particular graft rejection, graft versus host disease, allergy and

BiTAb1G1D-B7-24H6. The molecule consists of 4 scFvs, i.e. 2

anti B7.1 scFvs and 2 anti B7.2 scFvs (tetravalency). One single

BITAb is a homodimer of 2 identical molecules, each containing both

c and anti B7.1 scFv are linked using a dimerisation domain (see

M90219), which drives the homodimerisation of the molecule. DNA

(see x01552) encoding the BiTAb has been constructed to allow

expression of the BiTAb in transformed E. coli cells. The BiTAb

cross-links, and/or cross reacts, with the costinulatory molecules

B7.1 and B7.2 that are expressed on the membrane of professional

antigen-presenting cells, leading to the inhibition of antigen-

specific T cell activation. The invention relates to such

B7-binding molecules, methods for their production, and their use

for treating or preventing diseases of the immune system, in

particular graft rejection, graft versus host disease, allergy and

W90219), which drives the homodimerisation of the molecule. DNA (see X01651) encoding the BITAb has been constructed to allow expression of the BITAb in transformed E. coli cells. The BITAb cross-links, and/or cross-reacts, with the costimulatory molecules 97.1 and B7.2 that are expressed on the membrane of professional antigen-presenting cells, leading to the inhibition of antigen-specific T cell activation. The invention relates to such B7-binding molecules, methods for their production, and their use for treating or preventing diseases of the immune system, in particular graft rejection, graft versus host disease, allergy and autoimmune diseases (claimed).
                                                                                                                                                                                                                                                  This polypeptide comprises the bispecific tetravalent antibody BiTAbB7-24-IG10H6. The molecule consists of 4 scFvs, i.e. 2 anti B7.1 scFvs and 2 anti B7.2 scFvs (tetravalency). One single BiTAb is a homodimer of 2 identical molecules, each containing both an anti B7.1 and anti B7.2 scFv (bispecificity). An anti-B7.1 and and anti-B7.2 scFv are linked using a dimerisation domain (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                           New molecules which bind B7.1 and B7.2 - useful to prevent and treat immune diseases including allograft rejection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Key

                                                                                                                                                                CC (19G) heavy chain, IG V-III region (HV3T), An IgG derived peptide sequence from the human immunoglobulin GC (19G) heavy chain, IG V-III region (HV3T), An IgG derived peptide CC sequence having similarity to this sequence has a stimulating effect on CC the fibrinolytic activity of the scuPA/suPAR complex of the invention. The invention provides a thrombolytic therapeutic composition for the CC treatment and prevention of a thrombolytic disorder associated with CC the formation of fibrin clots. The composition comprises, as the active ingredient, a complex of a single chain urokinase type plasminogen activator (scuPA) and a soluble urokinase plasminogen activator receptor CC (suPAR). The complex (scuPA/suPAR) has thrombolytic activity under physiological conditions and in the presence of IgG, or of at least 1 IgG-derived peptide, and induces fibrinolysis of fibrin clots. The CC compositions and complex are useful for the treatment or prevention of CC compositions and complex are useful for the formation of fibrin clots, especially myocardial infractions, cerebro-vascular events, pulmonary cc embolism and deep vein thrombosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes pure zonulin which has an apparent molecular weight of 47 kb, as determined by SDS-PAGE, which is recognised by both anti-tau polyclonal antibody and by anti-zonula occludens toxin (ZOT) polyclonal antibody, and is capable of reversibly opening mammalian tight junctions. Zonulin proteins function as physiological modulators of mammalian tight junctions are they can be used for enhancing the absorption of therapeutic agents across tight junctions of intestinal and nasal mucosa and across tight junctions of the blood brain barrier. Zonulin can be used with agents such as drugs, e.g. lidocaine, adenosine, dobutamine, dopamine, epinephrine, nalbuphine, hupreporphine, phentolamine, doxapram, alientanil, dezocin, nalbuphine, hupreporphine, phentolamine, doxapram, alientanil, dezocin, nalbuphine,
                                                                                                                                                                                                                                                                               interferon-alpha, interferon-beta, interferon-gamma, interleukin-1 (IL-1), IL-2, IL-4, IL-8, polyvalent IgG, specific IgG, IgA, or IgM. The proteins can also be used for the production of antibodies which can be used to assay for zonulin in body tissue or fluids, or in affinity-purification of zonulin. The present sequence represents an N-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                      buprenorphine, naloxone, ketorolac, midazolam, propofol, metacurine, mivacurium, succinylcholine, cytarabine, mitomycin doxorubicin, vincristine, vinblastine, methicillin, mezlocillin, piperacillin, cetoxitin, cefenicid, cefmetazole and aztreonam, a hormone e.g. testosterone, nandrolene, menotropins, insulin, urofolitropin, testosterone, nandrolene, menotropins, insulin, urofolitropin,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New purified zonulin - which is capable of reversibly opening mammalian tight junctions, used for enhancing the delivery of across intestinal and nasal mucosa and blood brain barrier

The N-terminal sequences of human adult and foetal zonulins (see Y79130-36) were compared with Vibrio cholerae zonula occludens toxin (ZOT) tidentify a common motif thought to be involved in receptor binding. Peptide antagonists (see Y79105-29) based on this motif are useful as antiinflammatory agents for treatment of gastrointestinal inflammation, and for

Ig heavy chain precursor V-D-J region (JP-FL-4) - human
C;Species: Homo sapiens (man)
C;Date: 30-Sep-1991 #sequence_revision 30-Sep-1991 #text_change 16-Aug-1996
C;Accession: PH0118
R;Zelenetz, A.D.; Chen, T.T.; Levy, R.
J. Exp. Med. 173, 197-207, 1991
A;Title: Histologic transformation of follicular lymphoma to diffuse lymphoma realizable in transformation of follicular lymphoma to diffuse lymphoma realizable in translation not shown
A;Reference number: PH0115; MUID:91086845
A;Status: translation not shown
A;Molecule type: DNA
A;Residues: 1-148 <ZEL>
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin
C;Keywords: heterotetramer; immunoglobulin
F;10-148/Froduct: Ig heavy chain #status predicted <MAT'>
F;34-117/Domain: immunoglobulin homology <IMM>
   C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin
F;1-19/Domain: signal sequence #status predicted <SIG>

Ig heavy chain V region (anti-DNA, III-3R) - human (fragment)
C;Species: Homo sapiens (man)
C;Species: 09-Oct-1992 #sequence_revision 09-Oct-1992 #text_change 16-Aug-1996
C;Accession: PH0872
C;Accession: PH0872
R;Manheimer-Lory, A.; Katz, J.B.; Pillinger, M.; Ghossein, C.; Smith, A.; Diamond, B.
J. Exp. Med. 174, 1639-1652, 1991
A;Title: Molecular characteristics of antibodies bearing an anti-DNA-associated idiot A;Reference number: PH0862; MUID:92078875
A;Accession: PH0872
A;Molecule type: DNA
A;Residues: 1-97 <MAN>
A;Residues: 1-97 <MAN>
A;Residues: 1-97 <MAN>
C;Comment: This antibody is produced by Epstein-Barr virus-transformed B cell that be C;Superfamily: immunoglobulin v region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin homology
F;30-35/Region: complementarity-determining 1
F;49-66/Region: complementarity-determining 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A; Molecule type: DNA
